Name of Stakeholder: FOUR PAWS in South Africa

Contact Person: Fiona Miles, Director of FOUR PAWS in South Africa: Fiona.miles@four-paws.org +27 21 702 4277

8th September 2022

Dear Director-General,

FOUR PAWS in South Africa greatly appreciates the opportunity to provide comments in response to the consultation on the Draft White Paper on Conservation and Sustainable Use of South Africa's Biodiversity 2022. We are encouraged by the intention set out in this white paper to transform the current status of conservation, animal welfare and the sustainable use of South Africa's biodiversity and wish to make further comments on the white paper.

We are the South African office of the international animal welfare organization, FOUR PAWS, which seeks to protect animals under direct human influence. Our expertise lies within the topic of big cat protection, our work in South Africa involves research and investigation into the commercial big cat industry i.e., the farming of lions and tigers (non-native to South Africa) and the subsequent trade of big cats and their parts within and from South Africa. Our most recent research is a report that was released at the beginning of 2022 entitled, [Year of the Tiger? Big cat farming in South Africa: the need for international action](#). We also have extensive expertise in the rescue of captive-born big cats to our LIONSROCK Big Cat Sanctuary in the Free State. We operate sanctuaries across the globe with LIONSROCK Big Cat Sanctuary alone having rescued over 100 big cats from exploitative conditions. The facility is a True Sanctuary, meaning that no exploitation of animals occurs, there is no breeding, no trading, and no human interactions. The topic of big cats in South Africa will be the focus of our comments on this consultation.

In addition, we would like to take the opportunity to share the results of a survey we have recently undertaken into the perceptions of the South African public with regards to their opinions on the treatment of big cats in South Africa. We will be releasing the survey this year and when published, we will share it with the Department. The survey covers commercial trade, private keeping and trophy hunting. This is highly pertinent, given that lions and leopards were specifically included in the draft policy position on sustainable use and conservation of five iconic South African species, and that South Africa has implications on non-native species that are kept and traded in the country.

We are hugely encouraged by the objective of this white paper to transform the current status of conservation of South Africa's biodiversity and applaud Minister Creecy and the Department for taking these important and progressive steps. We hope our comments will help South Africa to further establish itself as a leader in wildlife conservation and look forward to opportunities to participate in the process of the development of this White Paper. We have removed the column that questions our support as our position is that we are supportive of the broad concepts of the White Paper and have commented on individual sections throughout. We have removed sections where we cannot offer recommendations, the result is that our comments in this submission are largely where we would make amends.

Yours Faithfully,

Fiona Miles
Director

What do you see as main <u>benefits, Implementation/ Compliance costs and risks?</u>	What <u>amendments</u> do you propose?
General Comments	
<p>The 2022 draft white paper on the conservation and sustainable use of South Africa's biodiversity clearly indicates the serious intent of the Department of Environment to make transformative changes to the way South Africa approaches biodiversity conservation. We fully support the understanding echoed in the paper that nature has its own intrinsic value, beyond economic worth. Safeguarding nature & wildlife would, in itself, have significant economic benefits in the form of tourism, reputation and investor sentiment. The acknowledgement of animal sentience within the white paper, indicates the progressive leadership that South Africa intends to protect its renowned biodiversity.</p> <p>While we are hopeful that the improved definitions of sustainable use may reduce the risk that species in South Africa will be exploited, we have concerns regarding the very notion of sustainable use and would like to raise issues that were not raised within the paper, in relation to the recognition of sentience and the impacts on native and non-native big cat species.</p> <p>The paper recognises animal well-being and acknowledges that South Africa is a signatory to the International World Organization for Animal Health (OIE) and as such, must recognise animal sentience. This means that South Africa accepts that animals have the capacity to experience positive and negative feelings including the feeling of pain and ability to experience suffering. The captive lion breeding industry is in direct conflict with this notion. In contrast the lion breeding industry has been allowed to flourish and grow unregulated for decades and as a result, it has caused the unnecessary suffering and killing of thousands of animals. The welfare of a lion is a complex issue as the animals have vast spatial and</p>	<p>For South Africa to truly recognise and include animal sentience, welfare, and well-being in law, it must end not only the captive lion breeding industry, but the entire South African commercial big cat industry should be reformed.</p> <p>While we applaud the commitment South Africa has announced it will phase out the captive lion breeding industry, tigers (which are endangered and non-native to South Africa) are also intensively bred for a commercial trade in live animals and their body parts from and within South Africa. The species is of course sentient and has similar spatial and ecological needs than other big cat species. South Africa must take actions to ensure non-native species are protected. Of the South African public that were interviewed in our survey, 71% said that Government should include other big cat species in the proposed changes to legislation (phase out of the captive lion industry).</p> <p>Given the commercial big cat industry extends to South Africa's trophy hunting of leopards, we would urge the Department to consider how this White Paper, which contains progressive positions of animal welfare, sentience and well-being, contradicts the hunting of leopards and how to address this. Leopards are an Appendix I species in terms of CITES and listed as vulnerable according to the IUCN Red List, and as such, the hunting and trade of these animals and their body should be heavily restricted to protect their wild populations. As such, South Africa must takes steps to ensure it adequately undertakes this commitment and reduces the killing of leopards for profit.</p>

ecological needs. Needs that cannot be met when kept in enclosures that are a fraction of their home range in the wild and housed together in unnatural groupings and conditions that are vastly different to what any wild lion would experience. The conditions of the animals and keeping conditions are not the only welfare concerns but also the manner to which they are bred which has been documented many times to show inbreeding and a lack of genetic diversity and purity. There can be little doubt that the welfare needs of an animal such as a lion or any big cat, can be met when bred in captivity and fed by humans.

The captive lion industry is driven simply by commercial profit and does not consider the welfare of the animals aside from what aids the delivery of such profits. There have been numerous studies, reports and investigations that have demonstrated how the animals are often kept in poor captive conditions, overcrowded, disease-ridden enclosures^{A,B,C,D}. In our unpublished 2022 independent opinion survey, of the South African public who had visited a captive big cat facility, at least one in three were concerned about the size of the enclosure the big cats were kept in, the number of animals per enclosure, and the condition of the animals.

Further reports have demonstrated how the captive lion industry has acted as a conduit for illegal trade, not only for lions but other big cat species, such as tigers⁴. These reports are not one-off cases, they are an example of the way the nation-wide industry operates, facts and statistics that are backed by the seizure records of the South African authorities.

The captive tiger industry in South Africa is suspected to have grown in recent years in response to the pausing of the lion bone quota export in 2017 and 2018. This is difficult to assess as no one knows how many tigers are in the country but trends can be noted through assessment of data from the Convention on International Trade of Endangered Species (CITES) Trade Database. It can also be concluded with some confidence that the increase in

Further research is required to ascertain the true economic value of the captive breeding industry versus the economic loss that South Africa incurs due to the captive breeding industry damaging tourism, South Africa's reputation and investor sentiment.

The primary purpose of s24 of the Constitution is to protect the environment, not to promote social and economic development. The White Paper should accordingly omit any provisions that afford social and economic development equal weight to environmental protection.

In order to improve the conservation status of all big cats, the captive breeding of CITES Appendix I specimens should be criminalized in South Africa, in addition to South Africa ending the breeding of captive lions.

We recommend that the word "conserved" be replaced with the word "protected" in Guiding Principle 9.4.9, so that the definition of Conservation under section 4.2, which makes reference to human benefit, does not read into Guiding Principle 9.4.9.

media reports and tigers sold on the public domain that the number of tigers that are kept in South Africa as pets is also increasing. This is an issue that has been reported much more frequently in the last few years and demonstrates how easily accessible tigers are in South Africa and how little their keeping is regulated.

Importantly, the captive breeding of tigers for commercial trade in live animals and parts both within and from South Africa directly contravenes CITES Decisions and Resolutions. This has been reported to the Department for Forestry, Fisheries and Environment a number of times by FOUR PAWS and is extensively documented in the previously mentioned FOUR PAWS report, *Year of the Tiger? Big cat farming in South Africa: the need for international action*.

The commercial big cat industry in South Africa also extends to the significant export trade in leopard parts through hunting trophies and the trade in live jaguars and their parts from captive sources has also increased in recent years.

Currently wild populations of all five big cat species of the Panthera genus are in decline , with trade being a contributing factor to these population trends. Encouraging the trade of live animals and their parts from captive sources stimulates the demand for the use of their parts in other areas of the world. All big cat parts can be used interchangeably as once the skin is removed, it is not easily possible to distinguish between species. This means that all big cat species are threatened by commercial trade, thus, South Africa has the potential to contribute to the conservation of non-native big cat species. In addition, it means that captive big cats and wild populations of big cats are equally at risk. The draft White Paper references the fact that South Africa wishes to be seen as a global player in conservation, but it is important to recognise that whilst big cat farms (lions and tigers) are allowed to grow and export then South Africa is not only contributing to the decline of an indigenous species in the lion but

also contributing to the decline and negatively affecting conservation efforts in other areas of the world for the tiger.

Interpretation of Legislation

In excess of 30,000 species are currently under threat of extinction and the resulting loss in biological diversity is bound to have a devastating impact on ecosystems and the value that humans derive from these species. Many of these species are threatened due to the high value that some live animals or their parts fetch in the international marketplace.¹ The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES),² to which South Africa is party, is the primary instrument that sets out the international legal framework to halt trade in endangered species and regulate trade in other species. It is important to note that the purpose of CITES is to prevent unsustainable trade, not to promote sustainable trade.³

Section 24 of the Constitution states that:

“Everyone has the right—

- (a) to an environment that is not harmful to their health or wellbeing; and
- (b) to have the environment protected, for the benefit of present and future generations, through reasonable legislative and other measures that—
 - (i) prevent pollution and ecological degradation;
 - (ii) promote conservation; and
 - (iii) secure ecologically sustainable development and use of natural resources while promoting justifiable economic and social development.”⁴

⁴ Constitution of the Republic of South Africa, 1996 (Constitution), at § 24.

Here it is important to take note of the qualifying terms used. S24(b) clearly expresses that the environment should be protected through measures that promote conservation. The use of natural resources and promotion of economic and social development, however, have been qualified by the requirement for these actions to be “ecologically sustainable” and “justifiable” respectively. The primary purpose of s24 is thus to protect the environment, not to promote social and economic development. The White Paper should accordingly omit any provisions that afford social and economic development equal weight to environmental protection. An anthropocentric exploitive approach to conservation would likely lead to further increase in trade and the degradation of success in conservation efforts. It is furthermore worth reiterating that the Constitution prevails over any other law and conflicting intention that may be set by policy makers and the captive breeding industry.

How Does Captive Breeding Adversely Affect Conservation?

South Africa’s lions are listed in CITES Appendix II and lion bone has been legally traded internationally from South Africa since 2008 when the first CITES permits were issued. The captive breeding of lions as a legal commercial activity has increased significantly since 2008.⁵

CITES Appendix I species are subject to an exception that treats them as being in Appendix II if they are captive-bred for commercial purposes.⁶ As mentioned above, Leopards, tigers and jaguars, all of who are listing in CITES Appendix I, are thus also bred in captivity for commercial gain in South Africa.⁷

A comprehensive study⁸ published in 2022 shows strong evidence that CITES listing of commercially targeted mammalian species leads to improvements in conservation status and that prohibitions on international trade have been successful in advancing the survival of mammalian species. Importantly, these prohibitions were shown to be particularly effective when there are no exceptions to the Appendix I prohibition. As mentioned above, the captive breeding of listed species has furthermore been shown to fuel demand and increase the value of specimens, which could incentivize illegal trade in wild populations.⁹

⁹ TANYA WYATT, *IS CITES PROTECTING WILDLIFE?: ASSESSING IMPLEMENTATION AND COMPLIANCE* 11 Routledge, (Taylor & Francis Group) (2021), at 65.

CITES sets minimum standards for international trade in wildlife and, if a country wishes, it may implement stricter measures nationally. It is thus our recommendation that, in order to improve the conservation status of all big cats, the captive breeding of Appendix I specimens should be criminalized in South Africa, in addition to South Africa ending the breeding of captive lions.

As mentioned previously, the purpose of CITES is to prevent unsustainable trade, not to promote sustainable trade by creating mechanisms that promote captive breeding for commercial gain. This sentiment is echoed in Guiding Principle 9.4.9 of the White Paper, which instructs that nature has intrinsic value regardless of whether it benefits humans and that such intrinsic value must not be discounted against economic value. However, we recommend that the word “conserved” be replaced with the word “protected” in Guiding Principle 9.4.9, so that the definition of Conservation under section 4.2, which makes reference to human benefit, does not read into Guiding Principle 9.4.9.

Traditional Medicinal Use of Animals:

The use of animals for traditional medicinal purposes is rapidly expanding, despite concerns about the impact of the trade on biodiversity.¹⁰ Various critically endangered (CR), endangered (EN), vulnerable (VU), near threatened (NT), and vulnerable (VU) vertebrate species (listed on the IUCN Red List)¹¹ are being traded for traditional medicinal purposes in South Africa, some of which may be acquired from captive breeding facilities, including:¹²

- African buffalo (*Syncerus caffer*) (NT)
- African savanna elephant (*Loxodonta Africana*) (EN)
- African wild dog (*Lycaon pictus*) (EN)
- Brown hyaena (*Parahyaena brunnea*) (NT)
- Ground pangolin (*Smutsia temminckii*) (VU)
- Hippopotamus (*hippopotamus amphibius*) (VU)
- Leopard (*Panthera pardus*) (VU)
- Lion (*Panthera leo*) (VU)

¹¹ https://www.iucn.org/resources/conservation-tools/iucn-red-list-threatened-species#RL_index ; <https://www.iucnredlist.org/> (last visited Feb. 23, 2022).

¹² Martin John Whiting et al., *Animals Traded for Traditional Medicine at the Faraday Market in South Africa: Species Diversity and Conservation Implications*, JOURNAL OF ZOOLOGY (1987), VOL. 284, NO. 2, 2011, at 88,92.

Animal-based traditional medicines are often made from animal tissues and organs that are processed into various forms such as slices, powders or tablets. This makes it difficult to identify the species being traded.¹³ Increasing demand for animal parts furthermore encourages traders to include various potentially harmful adulterants in medicines or to mislead consumers as to what they are actually buying. It is thus likely that some products are fake and that consumers or traders are unable to verify the species being traded.¹⁴ The availability of animal parts from captive breeding facilities is further exposing consumers to the risk of purchasing harmful, unidentifiable animal-based products from unmonitored facilities that may be evading the provisions of the Meat Safety Act 40 of 2000. This influx of animal parts from captive breeding facilities furthermore increases the risk of zoonotic diseases spreading from captive breeding facilities to traditional medicinal markets. Robust efforts must thus be made, in order to protect consumers and promote conservation of species, with a view to maintaining ecological sustainability in light of cultural demands.

Various Stakeholders:

The White Paper affects the interests of numerous stakeholders that have differences in ideology, purpose, scope and agenda, including environmentalists, preservationists, animal protection organizations, breeders and pro-hunting groups. This diverse group of stakeholders make valuable contributions to the conservation of species by sharing their specialized knowledge and bringing varied, opposing viewpoints to the table, to provide decision makers with a balanced understanding of the pertinent issues. Each of these stakeholders hold valid interests in the matter. It is thus important to understand that the economic interests of the captive breeding industry do not prevail over the interests of South African citizens or animal protection organizations.

Protected Areas:

Whilst it is important that the government implement effective strategies to protect and conserve South Africa's iconic wildlife and habitats, this is certainly not the only method to achieving optimal conservation. Ending captive breeding would play a pivotal role in protecting South Africa's biodiversity. Captive breeding and environmental protection do not operate in isolation from each other.

4. DEFINITIONS

We would applaud the new draft definition of sustainable use within the white paper. This outlines a much more progressive approach, than seen previously, that addresses ecological integrity of the ecosystem in which animals reside. We would note that while ecological integrity is discussed within the definition, “ecologically sustainable use” as per Section 24 of the Constitution, is not included throughout the document. The word “ecologically” must be included with the term “sustainable use” throughout the draft white paper, as no use can be sustainable if it is not ecologically sustainable.

The definition of conservation within the white paper can be deemed to contradict itself, and the intrinsic value of biodiversity that is mentioned throughout the document (e.g. Guiding Principles 9.4.9) that state nature has value in its own right. Instead, the definition of conservation in the white paper advocates among other points, that the protection of wildlife takes place, with the purpose to “secure equitable and ecologically sustainable use, access.”

In addition, the acknowledgement of animal sentience and the conservation of species cannot be achieved if the approach to “sustainable use” of biodiversity allows for any captive breeding of big cats. The existence of a commercial captive big cat industry will not only contradict the acknowledge of welfare and sentience but further damage the reputation of South Africa in conservation and eco-tourism.

It should additionally be noted that the intensive farming of wild animals in general, as is described within the Department’s Draft Game Strategy, is also incompatible with the recognition of animal sentience and intrinsic value of biodiversity. We would urge that the Government clarifies whether the wildlife species that have previously been listed as agricultural animals, for example lion, cheetah, giraffe, will continue to be listed as such or whether this list will be revoked.

The word “ecologically” must be included with the term “sustainable use” throughout the draft white paper, as no use can be sustainable if it is not ecologically sustainable.

The definition of conservation requires a less anthropocentric viewpoint in order to truly acknowledge the intrinsic value of nature and biodiversity that is reflected by Guiding Principle 9.4.9. We recommend a clear focus on the industry and ecosystem service value of wildlife and biodiversity, with all the benefits this brings for human health and well-being and to the wider economy, as opposed to the existing focus, which is the commercial value of wild animals through simply extractive and exploitative use.

South Africa must proceed with plans to end the commercial captive lion breeding industry and include other big cat species within this legislation. This is necessary to sufficiently reflect animal sentience and well-being for big cats in South Africa.

6.2. STATUS OF BIODIVERSITY	
<p>While we agree with the status of biodiversity in South Africa, the assessment was limited to a relatively high level positioning. It could have been improved to address which species were most threatened, in order to inform this Draft White Paper.</p>	<p>A more detailed status of biodiversity assessment should be undertaken to understand exactly which native species are most threatened in South Africa and what the immediate contributors to their decline are. We recommend that this is added to section 11.6 Priority Action on page 73.</p>
6.3. PRESSURES AND DRIVERS	
<p>The white paper documents increasing international wildlife trafficking syndicates in South Africa, supplying species subject to global trade bans to overseas markets. FOUR PAWS in South Africa would like to emphasise that our research (reported in <i>Year of the Tiger? Big cat farming in South Africa: the need for international action</i>), demonstrates the lack of adequate and effective regulations for the keeping and breeding of all big cats in South Africa.</p> <p>In addition, that the existence of a legal lion bone trade has allowed a partially regulated legal industry to flourish whilst also acting as a conduit for an illegal trade (for example, of other big cat species from South Africa. e.g. tigers). The United Nations Office for Drugs and Crime (UNODC) previously reported that some of South Africa's facilities breeding tigers in South Africa, may be the source of illegal international trade and that the breeding facilities seem not to align with CITES Decisions (specifically 14.69) .</p>	<p>South Africa must end the captive lion breeding industry, and the wider commercial big cat industry. South Africa must address and implement international agreements (CITES Decisions), alongside targeting international wildlife trafficking syndicates to protect all big cat species.</p> <p>We look forward to seeing the progression of the development of the Lion Task Team to tackle this matter and urge the Department to widen the group's scope to include the phase out of the intensive breeding and trade of all big cat species.</p>
9.1. A VISION and 9.2 THE MISSION	
<p>We are supportive of both the Vision and Mission as set out in the White Paper, but have made recommendations for clarity of the Mission.</p>	<p>We would urge the Department to consider clarifying that socioeconomic development should only be delivered in a manner that is also ecologically sustainable. In order to be ecologically sustainable, it is likely that the benefits to socioeconomic development will be long term and may not achieve 'quick wins.' For example, tourism is a major industry to the South African economy. Ethical, environmentally and animal-friendly tourism is a growing industry, where the majority of tourists seek ethical wildlife experiences. Transitioning to an ethical tourism industry, where the sector involves wildlife, would help to secure and enhance socioeconomic</p>

	development, though it would involve significant steps such as the reform of the commercial big cat industry, as a previously mentioned
--	---

9.4. GUIDING PRINCIPLES

<p>The Guiding Principles are important in influencing the transformation outlined in this White Paper. However, they are deemed to be slightly contradictory to one another. Guiding Principle 9.4.9 is invaluable to demonstrating the true value of nature and an incredibly important principle to the white paper. However, Guiding Principle 9.4.2 People First, contradicts this sentiment and Guiding Principle 9.4.5 Ubuntu. That “biodiversity must be protected in a way that people can benefit from its presence and use,” does not align with the sentiment of intrinsic value. This principle takes a view that is hugely anthropocentric and is one that is further echoed in sections throughout the white paper.</p>	<p>FOUR PAWS in South Africa recommends that Guiding Principle 9.4.2 People First, is removed as it is contradictory to other principles and is not aligned with a vision of harmonious co-existence. Human benefit should be ancillary to the protection of the environment, it should not be the primary goal.</p> <p>We also recommend that the word “conserved” be replaced with the word “protected” in Guiding Principle 9.4.9, so that the definition of Conservation under section 4.2, which makes reference to human benefit, does not read into Guiding Principle 9.4.9.</p>
--	---

10.1. The Rationale for goals and objectives.

Goal 3 Biodiversity Conservation Promoted

<p>Goal 3 regarding Biodiversity Conservation Promoted: Conserve the diversity of land and seascapes, ecosystems, habitats, ecological communities, species, populations, and genes, encompasses contradictory statements. The policy objective of 3.7 seeks to “support, complement, and enhance in-situ conservation and ecologically sustainable use through ex-situ practices.” This in itself is problematic as it creates the opportunity to further commercially exploit wild animals.</p> <p>In addition, two expected outputs of this Goal, under policy objective 3.7, include:</p> <ul style="list-style-type: none"> • Expected output 9: Domestication of wild animals reversed. 	<p>Ex-situ practices must be limited to exceptional circumstances where these practices are absolute necessary to protect the species populations in the wild and thus, contribute to conservation. This would include for example, rescue, rehabilitation, or breeding in captivity, only for the purpose of release into the wild to bolster wild populations.</p> <p>Expected output 13 of Goal 3, under policy objective 3.7 regarding promotion of biodiversity conservation, must be re-written to ensure the captive lion breeding industry cannot continue under the claim of sustainable use or for commercial purposes.</p>
--	---

• Expected output 13: Responsible ex-situ propagation and breeding for commercial purposes should also have a demonstrable conservation benefit, or, must at least advance sustainable use.

The expected outcome of the reversal of the domestication of wild animals will be invaluable both to the conservation of wild lion and the prevention of exploitation of captive lions. We urge the inclusion of other big cat species, in particular tigers, within this as previously mentioned. However, the expected output 13 is in direct conflict with the reversal of the domestication of wild species and raises the concern that the captive lion breeding industry will be allowed to continue under the claim of advancing sustainable use. It was the promotion of sustainable use that allowed the establishment of the captive lion breeding industry in South Africa. This has seen the country receive international pressure to reverse it, which the Government has made the first commitment towards.

Again we would like to reiterate that the captive big cat industry in South Africa has clear commercial intent. Lions and tigers are used to make profit at every stage of their lifecycle. As cubs, animals are used in cub petting and as photo props. As juveniles they may be used in 'walk with' experiences, before they are hunted for trophies or used as breeding stock, before their bones and other body parts may be shipped to other parts of the world. There is no true conservation claim with regards to captive big cats in South Africa. Captive lions and other big cats in South Africa have no genetic or ecological value, given that they are born and bred in captivity and can never be released into the wild. Therefore, their breeding has no conservation benefit. Instead, the trade in captive animals is detrimental to wild populations, as it encourages the demand for use in live animals and their parts elsewhere, which threatens wild populations, and, captive lions are known to harbour zoonotic diseases which risk transmission to the wild population. This concern is included within objective 10.1.2.9

We propose the amendment of wording included in Expected Output 13: "Responsible ex-situ propagation and breeding should also have a demonstrable conservation benefit"

<p>'prevent where possible, or minimise the risk of the animal-human transmission and further evolution of zoonotic diseases associated with wild animals.'</p> <p>In addition, we would like to share that our 2022 survey indicates that 66% of the South African public that were interviewed in our survey, do not support big cat farming for commercial purposes in South Africa.</p>	
<p>Goal 4 Responsible Sustainable Use</p>	
<p>There are too many variations of the term 'sustainable use' that are used throughout this White Paper, this is particularly relevant in this Goal. Variations include 'ecologically sustainable use', 'responsible sustainable use,' and 'sustainable use'.</p> <p>In addition, there are specific objectives that fall under this goals FOUR PAWS in South Africa cannot support. This includes that 'international trade in biodiversity promotes biodiversity conservation, equitable socio-economic development, and protects biodiversity heritage.' This phrasing is misleading and assumed benefit of international wildlife trade, and does not consider that if exploited, it can be of great detriment to biodiversity.</p>	<p>Recommend that only 'ecologically sustainable use' is the only variation used within this document. This will eliminate the possibility for exploitative loopholes to develop.</p> <p>We would urge the Department to remove or amend wording that suggests that international wildlife trade directly promotes biodiversity conservation, equitable socio-economic development, and protects biodiversity heritage. International wildlife trade can be highly detrimental to wild populations species, for example, it can stimulate the demand for the use of wild animals and their parts elsewhere. This in turn can allow the exploitation of captive animals and threaten wild populations.</p>
<p>Goal 6 Enhanced Capacity</p>	
<p>FOUR PAWS in South Africa supports objectives 10.1.5.1 – 10.1.5.4 and 10.1.5.6 that enhanced capacity is necessary to conserve South Africa's biodiversity.</p>	<p>We do have concerns surrounding 10.1.5.5: 'indigenous/traditional knowledge and practice provides localised solutions to biodiversity conservation and sustainable use.' This must be in a manner that is both ecologically sustainable and humane. This is an imperative.</p>
<p>Goal 8 Promote the Conservation and Sustainable Use of Biodiversity at the International Level</p>	
<p>We support the important notion that conservation of biodiversity is common concern of all nationals. This underpins the principle that biodiversity has its own intrinsic value and must be protected in its own right. As stated in the Draft White Paper, South Africa has committed, by way of active participation, in a range of international agreements towards the aim of promotion of conservation of biodiversity. This includes CITES and as previously stated,</p>	<p>We urge the Department to address the risk of contravention of CITES Decisions and Resolutions with regards to non-native species and implement existing CITES Decisions and Resolutions for big cats as effective national policy and legislation. This will require a comprehensive audit of all facilities captively breeding and trading big cats in South Africa.</p>

<p>FOUR PAWS is concerned that South Africa is at risk of contravening a number of CITES Decisions e.g. Decision 14.69 and Resolutions e.g. Resolution Conf. 12.10, in regards to big cats (namely, non-native tigers). These concerns have been well-reported to the Department of Forestry, Fisheries and Environment by ourselves.</p>	<p>'Facilities of concern' should be identified using existing guidelines and transition away from commercial exploitation models and only breed and/or trade for strict conservation purposes.</p>
---	---

10.4. Policy Objectives and expected outcomes

10.4.2 Placing Sustainable Use in Context: a progressive definition for use in Policy and Legislation

<p>We are encouraged to see the transformation of South Africa's biodiversity and conservation sector is supported by the acknowledgement that there are a number of challenges associated within this space that must be addressed. Of those challenges listed within the Draft White Paper, we would like to record that we believe a number apply to the captive and commercial big cat industry in South Africa (as previously detailed). These include practices and processes that:</p> <ul style="list-style-type: none"> • Are not ecologically sustainable • Promote economic gain for the select few • Are not socially (or culturally) sensitive given the significance of these species in the wild. <p>We support the understanding that these “threaten South Africa’s reputation as a conservation leader and undermine competitiveness as a global ecotourism destination.” This is reflected in our independent survey that demonstrated that 68% of the South African public asked, believe that South Africa’s reputation is damaged because of the export of captive big cats.</p>	<p>We hope that alongside our support of specific pieces this section, the Government will seek immediate action, through the establishment of the Lion Task Team, to phase out the captive lion breeding industry and address the wider commercial big cat industry in South Africa.</p> <p>In addition, we would like to again, reiterate that in discussion of “sustainable use”, the word “ecologically,” must precede the phrase, to ensure there is not exploitation of its premise.</p>
---	--

10.4.2.1 Sustainable Use of components of biodiversity

<p>All four detailed components of sustainable use of biodiversity, as per this section, are incredibly important. These include that sustainable use:</p> <ol style="list-style-type: none"> a) Does not contribute to the long-term decline in the wild b) Does not disrupt the ecological integrity of the ecosystem in which it occurs c) Ensures benefits to people that are fair, equitable and meet the needs and aspirations of present and future generations d) In the case of animals, is humane, and does not compromise their well-being. 	<p>We urge the Department to seek immediate action, through the establishment of the Lion Task Team, to phase out the captive lion breeding industry. This must include other non-native species and must address the country’s wider commercial big cat industry in South Africa, that includes hunting.</p>
--	---

All four of these components directly contradict South Africa's commercial big cat industry. This includes the captive breeding and subsequent trade of big cats and their body parts (lions and tigers) and the trophy hunting and subsequent trade of big cats and their body parts (for example, leopards). The captive breeding industry contributes to the long-term decline in the wild by ensuring there is demand for the use of animals and their body parts elsewhere. This exploits captive animals and threatens the wild population. In addition, captive breeding can disrupt the ecological integrity of the ecosystem, through the threat of increased risk of zoonotic disease found in captive big cat facilities⁵ and by the possible, eventual removal of the species from the wild if the demand succeeds the survival of the wild population.

Point C) encapsulates very importantly that "sustainability implies continuity." Again, some of the key benefits from biodiversity that South Africa should be seeking, include gains in the long-term that will come from eco-tourism. The commercial big cat breeding industry and eco-tourism are not compatible and this must be urgently addressed (i.e. both the captive big cat breeding industry and the hunting industry), for South Africa to establish itself as a leader in the eco-tourism sector. Similarly, the commercial big cat industry in South Africa is in no way compatible with ensuring that animals are treated humanely and in a way that does not compromise their well-being. The very nature of captive big cat farming, trophy hunting, trade in live animals and their body parts, can not be humane nor without compromise to their well-being.

In addition, we would like to again, reiterate that in discussion of "sustainable use", the word "ecologically," must precede the phrase, to ensure there is not exploitation of its premise.

10.4.3 Placing animal well-being in context

FOUR PAWS in South Africa is in broad agreement with this section. There are a number of important points we support, including that anthropogenic activities must be regulated by legislation and international conventions. We are also encouraged to see the recognition of

There are no immediate recommendations on this section of Placing Animal Well-Being in Context, but again, we would highlight that according to the principles within this section, the captive big cat industry does not align with well-being and cannot continue in any form. We

<p>South Africa as a signatory to the International World Organization for Animal Health. It is vital that South Africa takes action to acknowledge that animal welfare is closely linked to animals' health, the health and well-being of people, and the sustainability of socio—economic and ecological systems.</p>	<p>therefore support the Department's plans to take action through the establishment of the Lion Task Team, to phase out the captive lion breeding industry. This must include other non-native species and must address the country's wider commercial big cat industry in South Africa, that includes hunting.</p>
---	--

11.3.4 GAPS WITHIN EXISTING LEGISLATION

<p>With regards to 11.3.4.5 Biodiversity is a Common Heritage to All, property rights and private ownership of animals in South Africa need to be addressed. The route of ownership of animals is a serious concern and does not echo the progressive promise of this White Paper. This reinforces the rhetoric that animals are commodities, contradicting the guiding principle of the intrinsic value of nature.</p>	<p>FOUR PAWS recommends that the notion raised within the Consultation on 12th August 2022, where it was suggested that wildlife should belong to the Nation, the State is the custodian and individuals seeking ecological sustainable use must be licensed, is further explored. The rhetoric that wildlife is a purchasable commodity for ownership, is a foremost threat for the conservation of big cats globally, and in South Africa has seen a large increase in the private keeping of big cats (lions and non-native tigers). We would urge that South Africa endeavours to become a custodian of keeping wildlife wild, where it belongs.</p> <p>Furthermore, FOUR PAWS recommends that South Africa enacts legislation that reflects the Decisions and Resolutions taken at the United Nations Conference of the Parties for the Convention of International Trade in Endangered Species (CITES). FOUR PAWS has written to the South African Ministry of Forest, Fisheries and the Environment on this matter and outlined several Decisions and Resolutions related to big cats that are not implemented in South Africa. We understand Decisions and Resolutions taken by Parties through CITES are not legally binding at Party level but in light of South Africa wishing to be a global leader in conservation, and the context of this White Paper consultation, we urge South Africa as a matter of urgency to ensure there is effective national legislation that echoes international agreements. Whilst some of the Decisions are not specifically for a species named in the White Paper, it is important to acknowledge that all captive breeding and trade in big cats and their parts have a knock-on effect on each of the big cat species.</p>
---	--

Additionally, FOUR PAWS recommends that South Africa revises existing legislation and policy to ensure matters such as the disposal of carcasses on breeding farms, the registration of births and deaths and the movement of all species listed in the White Paper (and indeed all related species such as tigers) are written into legislation and enforcement authorities are given an improved mandate to ensure such issues are enforced and those circumventing and ignoring such legislation and policy are held to account. Currently, provincial authorities do not know how many lions and other big cats' species are held in their jurisdiction and there are no records of disposal of carcasses or registration of births and deaths. This facilitates illegal trade which is why issues such as these and the enforced registration of all captive breeding operations must remain paramount in combating illegal trade.
