Transitioning away from mulesed sheep wool

A guide for brands and retailers on why and how

Updated in January 2021
“FOUR PAWS invites brands along the journey towards a mulesed-free wool supply chain. At the request of brands, we’ve put this guidebook together, which combines science, brand insights as well as information about the available solutions into one place.”

- Nina Jamal, FOUR PAWS

“At Patagonia, we believe that animal welfare is a fundamental consideration when choosing the materials we use in our products. It is not acceptable for animals to suffer in the name of performance, luxury or fashion. That’s why Patagonia played an active role in developing and supporting initiatives that enable us as well as other brands to source wool that is mulesed-free, traceable and third party certified. We encourage the industry to get behind mulesed-free wool and benefit from available guidance and experience of stakeholders that have become mulesed-free to achieve a more ethical supply chain.”

- Nicholas Allen, Patagonia

“Country Road Group and David Jones have been working closely with industry and key experts in animal welfare to better understand how best to improve standards across the wool supply chain and support the future of responsible farming. FOUR PAWS Australia has offered ongoing guidance and input throughout this process, and we are proud of this display of cross sector collaboration.”

- Eloise Bishop, Country Road Group and David Jones

FOUR PAWS is an international animal welfare organisation with headquarters in Vienna, Austria, and offices in 14 other countries, including Sydney, Australia. Founded by Heli Dungler in 1988, the organisation strives to help animals in need with sustainable campaigns and projects.

FOUR PAWS focuses on animals that are directly under human influence, for example stray dogs and stray cats, farm animals, companion animals and wild animals kept in inappropriate conditions. FOUR PAWS aims to help animals in need directly and quickly.

FOUR PAWS has achieved many lasting improvements for animals used within the textiles industry. In recent years this includes:

- Working with the European bedding industry to lead a successful industry wide transition away from the down of live plucked and force-fed ducks and geese.

- Continued support of the highly successful Fur Free Retailer program, a network of over 1,000 brands and retailers who stand united in their commitment against fur.

- Assisting the development of animal welfare certification systems, such as the Responsible Down Standard and the Responsible Wool standard.

Our vision is a world where humans treat animals with respect, empathy and understanding.

Overview

Consumers are becoming increasingly aware and concerned about the welfare of animals used by industry. Such concern extends to animals farmed for fibre, and the controversial animal mutilation practice of mulesing is a key issue.

A 2017 report found that 1 in 2 people will choose, switch, avoid or boycott a brand based on its stand on societal issues.\(^5\)

Due to the growing concern from consumers, over 100 retailers and brands have now committed to transitioning away from mulesed wool.\(^4,5\) This demand is also reflected by the growth in demand for non-mulesed wool and premiums which have doubled from 2016 to 2018.\(^8\)

Despite this, the Australian wool industry, which produces 90% of the world’s fine wool, and 75% of all apparel wool, is not adapting at the same pace.\(^3,10\) Unlike other wool producing countries, such as New Zealand and Argentina, mulesing remains widespread in Australia.\(^11,12\)

Brands and retailers have the power to influence the Australian wool industry and ensure better animal welfare is at the top of the agenda. With the right information at hand, brands and retailers can take proactive steps to avoid mulesed sheep wool and effectively communicate a stance towards animal protection to consumers.

FOUR PAWS has developed this guide to assist brands and retailers like yours, because you are a crucial part of the solution to transitioning towards an industry that better values the wellbeing of animals. Alongside information about mulesed-free wool assurance initiatives, you’ll be introduced to fellow brands and producers who have started the journey away from mulesed wool.

To develop this guide, FOUR PAWS consulted with fashion brands, Australian wool producers and sheep breeders, active members of the animal welfare and agricultural scientific community, the wool and sheep industry including Australian Wool Innovation and Woolmark, International Wool Trade Organisation (IWTO), the Commonwealth Scientific and Industrial Research Organisation (CSIRO), and several animal protection organisations.

“It’s an exciting time for brands to take a stand on animal welfare; in fact, consumers are demanding it!”

- Madelene Ericsson, Sustainability Business Expert, H&M group\(^3\)
There is a longstanding notion that the more wrinkles (excess skin) a sheep has, the more wool, and of higher quality, the sheep will produce. Unfortunately, this focus on selecting for increasingly wrinkled skin, has also created an animal who is highly susceptible to flystrike.

Since their introduction to Australia in the 1790s, the merino sheep has been selectively bred to increase its wool production. Combined with the later introduction of the highly-wrinkled Vermont merino, selecting for high wrinkle became a mainstream practice.

By the 1930s, flystrike had become a serious problem for Australian sheep due to the combination of breeding practices, a warm climate, inadequate monitoring, as well as the presence of blowfly Lucilia Cuprina.

What is flystrike?

Flystrike in sheep begins when blowflies lay their eggs on sheep. Blowflies are particularly attracted to wool stained with faeces and urine, as the subsequent skin irritations create the ideal environment for laying eggs. The areas primarily affected are around the hindquarters, and mostly in the area known as the 'breech' of a sheep.

After hatching, maggots bury themselves into the skin and flesh, and sheep can quickly become infested. These maggots can create wounds that, if left undetected and untreated, can lead to debilitating pain and even death.

Several factors contribute to flystrike risk, these include:

- animals having skin wrinkles,
- faeces in the breech wool, and
- urine in the breech wool.

The problem

Many wrinkled merino sheep in Australia are mulesed, because their body type is more susceptible to flystrike.
What is mulesing?

In response to regular outbreaks of flystrike, in the 1920s John Mules developed a quick and cheap technique to reduce flystrike risk; the mutilation practice mulesing.24

The process of mulesing generally entails the restraint of two to 10-week-old lambs, on their back in a metal cradle, while strips of skin around their breech and tail stumps are cut away by sharp shears.25 Once the wound heals, the scar tissue left behind reduces the amount of wool and wrinkles around the area.26

Mulesing is not commonly used in any other country; and Australia’s neighbour New Zealand has made the practice illegal.27 In Australia however, it is entirely legal to perform mulesing with or without the use of pain relief.28,29 While there is a lack of clear data available in relation to the proportion of lambs mulesed annually, the number is estimated to be over ten million.30,31

Learn about the impacts of mulesing over the page ⇒

Source: FOUR PAWS
Why mulesing is a problem for lambs

Mulesing causes intense pain

Of all the mutilations sheep face throughout their lives including tail docking and castration, mulesing is arguably the most controversial. Why? Because of the duration and intensity of suffering caused, particularly when flystrike can be managed in pain-free ways. The pain caused by mulesing is acute and can last up to three days. The impacts of mulesing are so intense that lambs can go into a state of shock, stand immobile and hunched following the procedure, leaving a wound that takes weeks to heal, and for some lambs the procedure can be fatal.

Researchers have further documented the extreme pain experienced by mulesed lambs, noting both elevated cortisol levels and behavioural indicators abnormal to healthy lambs. Such behaviours include a lowered head with noses almost touching the ground, sudden bolting and an unusually stiff walk. In addition, lambs will actively avoid the person who mulesed them for up to five weeks.

Mulesing causes fear and stress

The intense stress experienced during and after the procedure by lambs has been thoroughly documented. There is also industry wide recognition that lambs, after being mulesed, can lose weight and physical condition. Mulesing alone does not give susceptible sheep adequate protection against flystrike. Mulesed sheep can often still be struck on other parts of their bodies, this is known as body strike.

“...mulesing won’t stop the problem completely. We’ve had sheep with flystrike on their shoulder and on their head.”

- Sarah Calvert, wool grower Northern New South Wales.
**Mulesing with pain relief is not an adequate solution**

The Australian wool industry does not routinely provide adequate pain relief to cover the acute pain experienced during the surgery itself, meaning significant pain is still felt by the lambs. Post-procedure, lambs can still be seen standing hunched and immobile, alongside other indicators of pain.48

Best practice for any kind of surgery and any form of mutilation is to provide general anesthesia, as well as post pain relief, and drugs to reduce the inflammatory response. This is currently not happening, and therefore will not address the concerns of animal protection groups nor shoppers.

FOUR PAWS welcomes a legally binding commitment to pain-relief during mulesing, however it should only be considered as an interim measure.

It is encouraged that brands take a proactive approach to communicate with their supply chains that mulesing with pain relief can only be an interim measure.

---

**Why mulesing continues**

The following infographic gathers information from a range of primary and secondary sources and is largely based on in-person interviews. This research demonstrates the power that brands have in leading and moving the industry towards being kinder to animals.

### Brands

1. By continuing to sell garments made from mulesed sheep wool, brands are perpetuating the continuation of mulesing.
2. There is only a small number of brands that label the mulesing status on their garments. This prevents consumers from making an informed decision at the point of sale.
3. Many brands do not have a clearly articulated position on mulesing, nor a time-bound mulesed wool phase out target.
4. Brands are not yet dedicating enough time to consulting with and motivating their supply chain to change.

### Wool Industry

1. Lack of awareness, confidence and motivation
2. Tradition and social pressure
3. Limited leadership and support

- Many producers perceive mulesing to be the most effective, cost-efficient and quickest way to manage flystrike.47
- Wool prices and demand for wool are currently strong, and non-mulesed price premiums may not be widely known to the individual producer.
- Despite a significant number of Australian producers having ended mulesing, deep and wide-spread knowledge of and trust in the alternatives to mulesing may be lacking.
- It is almost a tradition in Australia for producers to grow wrinkly sheep who ‘need’ mulesing, and they may continue the practise to avoid being socially ostracised.20,51
- Producers may not wish to disrupt the often long-term relationships with mulesing contractors and/or their breeders, who may only produce sheep types that are susceptible to flystrike.
- Lack of political and industry leadership limiting progress to change.52
Mulesing is a problem for the fashion industry

In the early 2000s, animal protection campaigns by animal protection organisations including People for the Ethical Treatment of Animals (PETA) and Animal Liberation, largely drove the heightened awareness of mulesing that we continue to see today. These campaigns sent shock waves through the fashion world and in 2004 up to 60 brands threatened to boycott Australian wool.

The Australian wool industry’s leading body, Australian Wool Innovation (AWI), responded with a commitment to phase-out mulesing by 2010. A year before the deadline however, AWI went back on their word, stating that the industry would phase out the practice in its own time. Despite the failed industry commitment, mulesing is once again gaining consumer attention, especially as interest in ethical consumption and sustainable fashion continues to expand.

Corporate Social Responsibility (CSR) and animal welfare

The relationship between animal welfare, business profitability and risk, has been the focus of many think tanks and research projects. The Farm Animal Investment Risk & Return (FAIRR) initiative, a global investor network with more than $8 trillion in supporting assets, recently identified 28 financial risks associated with the factory farming industry - refer to FAIRR’s graph on the right. They found that processes and policies which do not address animal welfare could present risks that impact on a business’s production, reputation, market access, or cause other regulatory restriction. Within the scope of CSR, it is conceivable that the same risks are present in the wool industry.
Meet the brands turning risk into opportunity

“There shall be no mulesing of sheep used for wool production destined for VF products.”
- VF Corp

“To promote animal welfare, UNIQLO is abolishing merino wool suppliers who source from farmers practicing mulesing.”
- Uniqlo

“We require vendors to provide us only with non-mulesed wool, and require that all supplies disclose their country of origin and their suppliers of wool fibre. We continually evolve our traceability requirements of animal-based materials and are transitioning to 100% non-mulesed wool.”
- Lululemon

“Animal welfare has become very important. We’ve banned mulesing from our suppliers and we just won’t work with any growers who do that.”
- Jeremy Moon, founder of New Zealand brand Icebreaker

“By 2025 100% of our wool will be sourced in line with industry best practice, such as the Responsible Wool Standard (RWS).”
- Bestseller

“The long-term contracts we offer for non-mulesed wool give security to both parties and create a strong relationship between brand and farmers. To be willing to change the own way of thinking and acting has always been our key to innovation.”
- Stefan Krause, Head of Product, ORTOVOX

Alongside those quoted above, Marks & Spencer, Hugo Boss, Ortovox, H&M and more than 100 other brands have committed to the phasing out of mulesed sheep wool.

Most of these brands cater to consumers across Australia, Europe and the United States, some of the biggest consumer markets for Australian wool. With the growing concern for animal welfare, especially noted within these regions, and since consumer spending on wool is both largely discretionary and strongly linked to consumer confidence, it makes business sense to prioritise responsible sourcing.

“Consumers are increasingly seeking ethical fashion options, and this includes animal welfare. Mulesing continues to be top of mind for many consumers, and there’s a real opportunity for brands and retailers to capitalise on this gap in the marketplace.”
- Gordon Renouff Co-Founder, Good On You

Aside from risks to consumer confidence, poor ethical practices ultimately pose a threat to the level of investor interest and potentially the share price of a business. With these factors in mind, it is no surprise that premiums for mulesed-free wool are increasing as brands cultivate a growing supply. However providing incentives to ensure supply, is not the only way to achieve it.

“The wool consumer is increasingly demanding a higher level of traceability along the pipeline of the production system from which they buy. Not only does the product need to be of the highest quality, there also needs to be a compelling story behind the product clearly showing the highest level of environmental and social sustainability and animal welfare.”
- Andrew Blanch, Managing Director of New England Wool

Tips from brands making the transition over the page
The H&M group encompasses well-known and popular brands such as H&M, COS, Monki and Arket, among others. The group have an animal welfare policy covering all animal derived materials used by the group and in 2008, they banned mulesed wool.

Today, H&M requires all wool originating from Australia to be declared via the National Wool Declaration as Non-Mulesed or Ceased-Mulesed wool, until they reach their goal of 100% RWS certified wool.

The beginnings of the RWS

H&M group initiated the development of the RWS together with Textile Exchange back in 2014, due to a lack of robust international standards around at that time.

“We felt an increased need to secure the wool in the products from both an animal welfare and environmental perspective but at that time, there was not so many options around, other than a few local initiatives. Since there are a lot of other animal welfare issues to be addressed on farm level apart from mulesing, it became an issue we had to solve.”

- H&M group Sustainability business expert on ethical sourcing, Madelene Ericsson

But the real hands-on process started in 2016 when the standard was launched. H&M group began to introduce the standard to their key wool product suppliers and engaged each part of the supply chain step by step, through networking and trainings. At the same time, they also set a clear goal for the entire H&M group to clearly show their ambition. This was key to a speedy uptake.

By 2022 H&M group aims for all virgin wool sales to be 100% RWS certified.

Challenges and advice

H&M group’s main challenge with RWS in the beginning was availability.

“We really wanted to have certified wool earlier, but there was very little quantity available and no workable prices at that time. Rising prices on conventional wool globally also made it more difficult to also add the RWS upcharge and keep the internal buying surge. Additionally, there was quality concerns due to change of source origin.”

The chain of custody system that is part of the RWS certification was an important factor for H&M, however their supply chain preferred the mass balance system.

“Another challenge was that we had to push for chain of custody (CoC). We really want to be able to talk about the RWS wool in connection to the products, so there was some challenge in persuading all parts of supply chain on getting CoC.”

To help their supply chain comply with the RWS – and specifically the chain of custody system, H&M group needed to give them time to adjust, while remaining firm and clear that this was their new direction. Today, implementing the RWS for many of their supply chain partners has simply become business as usual. As a learning from the last years of sourcing RWS wool, H&M group recommends:

- Firstly, gaining internal back up, setting a goal, and communicating it both internally and externally.
- Building your connections around the supply chain, including within the upstream supply chain,
- Working closely with your suppliers to manage obstacles like changing lead times.

The very first RWS certified products for H&M group were launched through their brand Arket during fall 2018.

“RWS is definitely one of those things that we are extra proud to have been part of, and we are thrilled to see other brands now seeking RWS certified wool as well. You realize that together we can make improvements in an entire industry.”

H&M group uses mulesed-free wool

By 2022 H&M group aims for all virgin wool sales to be 100% RWS certified.
International fashion brand Esprit is widely known for its strong, positive stance towards sustainability. Esprit was one of the first brands to offer products made of organic cotton in the 1980s and has now also achieved several milestones in animal welfare. Esprit’s animal welfare policy includes a range of animal derived textiles including sheep wool, down and fur.

With regards to wool, Esprit’s animal welfare policy states that the organisation will only use non-mulesed sheep wool, despite around 20% originating from Australia. To help ensure the wool coming from Australia is non-mulesed, Esprit has defined two key strategies.

1. **By developing an in-house traceability system**

   While RWS certified supply from Australia is growing, Esprit has designed an in-house traceability system based on the National Wool Declaration (NWD) and the Australian Wool Testing Authority certificates. Assurances are made to Esprit in the form of PDF-certificates from the garment supplier. Esprit files and reviews these, ensuring the weight received corresponds with the purchasing order. Esprit acknowledges the limitations of this system.

2. **Committing to the Responsible Wool standards**

   Esprit has been certified by the Responsible Wool Standards (RWS) and seeks wool from producers who are also RWS certified. Esprit has found that RWS wool automatically comes with a clear chain of custody, therefore requiring less administration.

   Esprit has tried to coordinate direct farm partnerships in the past, however felt that their wool volume purchase is too low to establish a sustainable long-term relationship with farms directly.

   At an early stage, Esprit started a dialogue with their suppliers to discuss the sourcing of non-mulesed wool and encourages them to become RWS certified. Esprit as a brand is committed to sourcing only non-mulesed wool and wants to see mulesing come to an end.

   “Esprit is currently challenged to find enough of the right RWS certified wool, therefore we are encouraging producers to become certified. To fill the void we have set out clear commitments with each supplier. We’re also seeking wool from other low-risk countries (in relation to mulesing).”

   By 2022 50% of our wool products are planned to be RWS-certified. We encourage our key suppliers of wool styles to move forward with certification. Setting clear targets around our wool certification systems, the RWS and ensuring transparency with our consumers, were our natural first steps.”

   - Kristina Seidler-Lynders  
   Environmental Sustainability Specialist, Esprit
Well-known outdoor brand based out of New Zealand – Kathmandu, has made several public commitments to continually improve their sourcing and sustainability practices.

Kathmandu uses a substantial volume of merino wool in their products, most of which is grown on Australian farms. Their team is aware of the welfare issues involved in merino wool production and is committed to continuing to source only mulesed-free merino wool.

The collaboration between Kathmandu and the Responsible Wool Standard (RWS) has continued for some years. While progress in terms of sourcing RWS certified wool has been challenging due to limited availability, Kathmandu is making headway, sending a clear signal to growers that this certification is becoming increasingly desired. The Kathmandu team worked very closely with their supply chain partners, moving RWS certified merino from farmer groups, to top makers, spinners, knitters and finally their garment producer.

“We kicked off the pilot program in April 2016 when we visited our supply chain partners in Asia – top maker, spinners and knitters. Having undertaken 100% RDS (Responsible Down Standards) rollout across 100% of our product range, it meant that we had lots of learnings and understanding of challenges from a supply chain perspective. We had therefore designed our pilot program more around educating our supply chain; as that’s what we believed in for this pilot to be successful. We wanted the suppliers to tell us that yes it is the right thing to do rather than the other way around.

We understood quite early that the biggest hurdle would be on supply availability and prices. To alleviate this, we were focussed from the start on only converting a part of our merino range, and therefore exactly knew how much annual units we would buy, what would be the exact tonnes of RWS merino – bespoke quality, micron etc. required.

The drive to change needed to come from them and it did. We spent close to 60-70% of our time on this engagement/education part of the whole product development process through numerous on-site visits, office meetings, correspondences etc, asking them to be part of this journey where the destination – how/when was still unknown.

Commitment signals were passed onto all parts of the supply chain quite early and we were also supporting them through separate dialogues with farmer groups in AU/NZ and with Textile Exchange. Information flow was also key as whatever updates we had were also shared with the supply chain at the same time and vice versa. All the hard work was done by our supply chain partners and kudos to them; they are our real champions of change. We will be launching RWS certified products in stores in 2019 and are striving to get the rest of our merino range to be RWS certified as well.”

- Manu Rastogi, Textile R&D and Responsible Materials Manager, Kathmandu

Until all of Kathmandu’s products are RWS certified, the team also rely on the National Wool Declaration and Australian Wool Testing Authority certificates and check these and the volumes purchased against the volumes used within the garments they receive.

Source: Kathmandu
The alternatives to mulesing

While Australia may currently lack the leadership to drive an industry-wide ban on mulesing, the amount of mulesed-free wool being produced is slowly increasing.

A combination of alternative management practices are being adopted by producers to manage flystrike, and for many it is as simple as changing the type of sheep they keep.

“The first, and I would argue the most important issue to consider, is the genetic makeup of one’s sheep. It is well established from both research and every day observation that heavily wrinkled sheep are much more likely to be struck, if for no other reason than the retention of skin moisture within the wrinkles.”

- Andrew Greenwood, Principal, Eildon Springs Superfine and Fine Wool Merino Stud

The most effective, ethical and sustainable way to help manage flystrike is to combine good management techniques with good genetics. Animal protection groups are calling on producers to raise naturally flystrike resistant sheep, animals who are wrinkle-free, ‘smooth bodied’ or ‘plain’ bodied, and ideally are bare breeched (lack wool around their anus).

By implementing effective targeted breeding programs, it is possible to transition a flock of wrinkled sheep to one with these characteristics in less than five years. The timeframe however, is largely dependent on the type of sheep producers have to begin with, their capabilities, motivation, and their access to resources and support.

“There are many ways to manage flystrike that don’t include mulesing. By far the most economically efficient way is to grow wool from plain-bodied, flystrike resistant sheep. It’s a genetic solution, which can be applied within any area of Australia and has the best animal welfare outcomes. It’s about time Australia joined the 21st Century and ended mulesing once and for all.”

- Charles Massy, BSc., PhD and recipient of an Order of Australia Medal for his service as Chair and Director of a number of research organisations and statutory wool boards.

Note, the reduction in mulesed-free wool in 2018/19 is likely due to the overall decline in Australian wool production.
Sheep type plays a key role in managing flystrike

Flystrike resistant body types could be grouped into two broad categories:

1. What FOUR PAWS considers ‘Smooth bodied’ – these are wrinkle free sheep, with a thin and loose skin type, indicative of high density and a longer length of wool fibres.99

   With effort also put into encouraging a bare breech and/or the use of other management practices such as crutching (shearing wool around the breech), smooth bodied sheep are known to be naturally flystrike resistant and according to producers, have a low to nil dependence on insecticides.90,91,92

2. ‘Plain bodied’ wrinkle free sheep, who may have a thicker skin type.

   Depending on the characteristics, environment and/or management practices of flocks in this group, management techniques such as the use of insecticides, additional crutching, careful pasture management, well timed shearing, and/or more thorough monitoring may also be required.93,94

While it may be possible to avoid mulesing and continue to use flystrike susceptible/wrinkly sheep in some areas, these animals are at high risk.95

Smooth and plain bodied sheep provide a sustainable solution to flystrike

Several producers are striving for and achieving flystrike resistant qualities in their flocks, while claiming improvement in several welfare indicators. One example is the Soft Rolling Skin [SRS] group, with 30 studs across Australia, supplying over 1,000 farms.96 SRS breeders follow a set of breeding principles developed by former CSIRO scientist Dr Jim Watts.97

“Non-mulesed Merino sheep are already out there in large numbers, are naturally resistant to all forms of flystrike including the most severe, and body strike outbreaks during wet summers. There is no reduction in wool quality or quantity, in fact we have observed improvements, and definitely the environmental fitness and fecundity of these animals has improved.”

- Dr Jim Watts, founder of SRS Merino98

The image below was taken shortly after shearing and clearly depicts the wrinkly vs. smooth sheep skin types.

Source: Dr. Jim Watts of SRS Merino.
“Research has shown that it is possible to successfully manage non-mulesed sheep with little extra time or cost.”

- Department of Primary Industries and Regional Development, Western Australia
Transitioning to naturally flystrike resistant sheep types can result in benefits for producers

Some producers are reluctant to lose wrinkles; they fear a reduction in the weight and value of the fleece. This, however, is not necessarily the case.39

“Analysis of sires across Australia has shown there are individuals within a mob with low breech wrinkle (a flystrike resistance indicator) scores and higher than average fleece weights.”

- Department of Primary Industries and Regional Development, Government of Western Australia40

As highlighted earlier, in addition to selecting for smooth or plain bodied sheep, producers are also selecting for a bare breech. A bare breech means a natural absence of wool around the hindquarters of a sheep. According to the Australian Merino Sire Evaluation Association, selecting rams with a genetic history of bare breech in order to counter flystrike, need not come at the expense of other productive traits.101

Wool growers of plain and smooth bodied sheep also claim higher fertility rates and ewes rearing more lambs.102 Trials dating as far back to the 1960s back these claims and demonstrate that plain bodied sheep generally have more lambs than wrinkly merino sheep.103,104

There is no excuse for mulesing or any breech mutilation to continue long term

Transitioning flocks to sheep types who are naturally flystrike resistant is the most animal-friendly and sustainable way to manage flystrike. While several alternative mulesing procedures have been explored, including Steining/Freeze Branding, Skin Traction and Clips for example, these are yet to be proven effective without severely impacting sheep welfare.105,106

Read case studies to find out how producers are managing flystrike in alternative ways ➞
When did you stop mulesing?

In 2012, after branching out from my family’s farming operation and establishing my own business with my wife, Katie.

Why did you stop?

I had taken over managing the sheep breeding program in my family’s operation a few years prior, with a mind to breeding sheep better suited to our environment. And naturally, I wanted to achieve this without compromising quality, but preferably while reducing production costs. I quickly realised that I needed to breed sheep that required less husbandry, but were nevertheless robust enough to survive, and thrive, in sometimes harsh conditions. It was obvious to me that I needed to breed sheep that do not require mulesing. And basically, once I was out on my own, I was able to class my flock as I saw fit. I was very conscious about selecting for bare breeches and made a deliberate decision to cease mulesing that year. As much as possible, I like to involve my wife and children in the day to day running of the farm. However, mulesing is not a job I ever enjoyed, and certainly not one that I ever wanted to involve them in.

How long did it take you to transition away from mulesing?

Difficult to say really because my decision to cease mulesing was influenced by external factors. But, realistically it only takes perhaps two generations of breeding, using the right genetics, to transition away from mulesing.

How did you achieve this?

By consciously making the choice to select those sheep that were inherently predisposed to bare breeches and building my breeding program around them.

How do you manage flystrike today?

Thankfully, it is very rare that one of my sheep would be struck by blowflies. And, if one is I usually discover that that sheep is in my flock and does not exhibit the traits ie the bare breech as markedly as the stud sheep do. Such sheep are generally culled during routine classing. Obviously, I monitor the sheep for flystrike and treat if required, but I do not use a preventative, in fact, we use less chemicals than when we mulesed.

Do you grow the same amount and quality of wool?

I truly believe that my sheep produce far superior wool, more efficiently, than that of the traditional, heavy-skinned mulesed merino. There will always be sheep that are fed high protein diets and that are housed that will produce incredible fleece weights, and this will be promoted as the norm. In reality, I can confidently say that on average my sheep produce as much, if not more, higher quality wool than the traditional merino when exposed to the same environmental conditions.

What are some of the other benefits of transitioning away from mulesing?

Straight up, there are less production costs in labour and chemicals. Already, some wool buyers are paying a premium for non-mulesed wool. We suffer far fewer losses at lamb-marking time, far fewer losses to flystrike across the life of the sheep. And we have eliminated, quite frankly, what is an unpleasant experience for both lamb and farmer from our operation. Shearers appreciate it too as these plain-bodied sheep are much easier to shear and are virtually free from cuts and nicks. We truly have the best interests of the sheep at heart.

Do you feel the level of flystrike your sheep are experiencing today, is better or worse, now that you have stopped mulesing?

Better, without question.
**Errol Brumpton, Well Gully Merino**

Well Gully Merino is located 24km north of Mitchell in sub-tropical southwest Queensland. Since the early 1970s, when he witnessed flood-stranded sheep dying in droves from flystrike, merino stud breeder, Errol Brumpton (shown below with 18-micron wool), has been breeding sheep for flystrike resistance and supplying producers right across Australia.

The climate where Errol and his wife Candy operate their 2,400 hectare grazing operation swings between extremes: a hot, humid summer of up to 48 degrees Celsius drops to a cold frosty winter.

“I've found that if there is anything wrong with the skin structure of the sheep in this climate they will definitely get body struck in the summer months. Blowfly strike has pushed a lot of sheep out of this district because people found they were spending a lot of their time jetting sheep (with insecticides).”

We do not mules our sheep, we don’t jet and we do not get any breech strike or body strike other than a few isolated cases,” says Brumpton.

“A lot of our clients, particularly further north, are one man shows. When it rains in the Channel country, they can be cut off from their sheep for a long time so they need sheep that are easy to manage and will survive if the shearsers can’t get into the property for a few weeks.”

“I learned from a very young age that free growing, long stapled sheep rarely get flyblown. If the wool is well aligned and has a white wax it will absorb very little water and will dry out rapidly.”

“We had an incredibly wet humid summer this year with 800 millimetres of rain from November to January (2010-2011), and 290 millimetres in March. I couldn't believe what I saw. There was no body strike at all and one case of breech strike among the 4200 ewe and lambs. There was virtually no fleece rot and the wool was still pure white,” he says.108

**Philip Attard, Gostwyck Merino**

Gostwyck at Uralla in the New England region of New South Wales is owned and managed by Philip and Alison Attard. Over the past 17 years, Gostwyck has made many changes, notably the grazing management and animal welfare systems they have put in place as well as the focus on producing merino wool which is of 'next to skin' quality. According to Philip, Gostwyck Merino is 100% mules-free and has been since 2005.

“We just stopped and learnt the best way to manage using grazing rotation and applying the science available. And never started again, nor will we ever as the incidence of fly strike is far lower that when we mulesed.”

“The grazing methods employed as part of our advanced grazing systems have helped us to control flystrike. The sheep get a fresh grazing area twice a week, eliminating the problems of sheep camps. We also use less insecticides, a preventative measure to minimise flystrike.”

“As part of our grazing management we see all our sheep at least twice a week, and we are able to identify any isolated [flystrike] cases and treat them quickly.”

Gostwyck has a number of direct sales arrangements. They also use their own wool in the “Henry and Grace” baby wear range, showcasing the comfort factor. Gostwyck produces wool with an average micron of 15.9μ for adult sheep and 14.3μ for lambs wool, and has been Responsible Wool Standards (RWS) certified.109

Three steps to change

FOUR PAWS is calling on brands and retailers to take the following steps to help ensure mulesed wool is phased out and becomes a thing of the past.

**Step 1:**
Make a public commitment to end sales of mulesed wool within a set time frame.
- Communicate any new sourcing requirements, to each link within the supply chain and publicly.
- Know and publish the source and status of the wool used in your products. Where is the wool coming from? How is it certified? Is the wool mulesed, ceased or mulesed-free?
- Update company policies and ensure these are easily accessible to the public.

**Step 2:**
Implement robust traceability systems to ensure wool use is restricted to mulesed-free.
- Apply an internationally recognised certification system to garment production operations. Companies should seek a system which strives for the highest animal welfare standards and enables a clear chain of custody (consider options and their value in the table overpage). As the wool supply chain is particularly complex, FOUR PAWS strongly encourages brands and retailers to prioritise utilising initiatives which offer robust full supply chain traceability systems.
- For companies able to go the extra mile, recent research shows that best practice for supply chain assurance, is for companies to use a combination of both internal and external auditing services.¹¹⁰

**Step 3:**
Enable the customer to make informed decisions by clearly labelling whether a product is mulesed-free.
- Include the mulesing status of each garment directly to internal tags and price tags.
- Provide information online linking to an up-to-date mulesing policy, and proactively make your new commitment known to external brand ranking initiatives.

We understand that for some businesses who are not yet aware of the risk or the solutions, Step 1 may be the hardest! Our guidebook is designed to help overcome this.

Note, this is a rough guide based on a medium sized fashion enterprise with a willing supply chain.
Support available to assist brands in transitioning to mulesed-free wool

With demand increasing for mulesed-free wool, there are now several assurance initiatives available, as well as organisations and businesses providing advice and support to brands wanting to transition their wool supply. On the following page, you can find an overview of some of the mulesed-free wool assurance initiatives available and open to use for all brands. These include:

- **Responsible Wool Standard (RWS)**
  An animal welfare and land management certification standard, backed by a chain of custody system (CCS) and developed via a multi-stakeholder process.\(^{111}\)

- **ZQ Standard (ZQS)**
  A certification standard, that sets requirements for animal welfare and the environment (considered equivalent to RWS standards) with additional criteria for social responsibility.\(^{113}\)

- **NATIVA™**
  Chargeurs branded wool is a 100% traceable and sustainable global wool brand. They source wool globally in all microns and qualities, and comb in their four combing mills. The NATIVA™ Protocol certifies on Land Management, Animal Welfare, Environment, and CSR throughout the supply chain.

- **NewMerino® Standard (NMS)**
  A verification system and supply facilitation service, based on RWS standards for animal welfare and land management.\(^{112}\)

- **Authentico™**
  An integrity scheme that covers both wool production and subsequent processing, based on practices such as those identified by RWS, GOTS and ZDHC; with full traceability.\(^{116}\)

- **The Organic Content Standard (OCS)**
  A standard by Textile Exchange for tracking and verifying the content of organically grown materials in a final product.

- **The Global Organic Textile Standard (GOTS)**
  A processing standard for textiles made from organic fibres. It defines high-level environmental criteria and requires compliance with social criteria. Only textile products that contain a minimum of 70% organic fibres can become GOTS certified.

- **Sustainawool (SW)**
  A wool 'sustainability integrity scheme' and auditing processes aiming to address animal health and welfare, traceability, environment management and social responsibility.\(^{115}\)

- **National Wool Declaration (NWD)**
  A scheme which allows Australian woolgrowers to voluntarily self-declare the mulesing status of their clip for publication in wool sale catalogues, AWTA certificates and AWEX Mulesing Status Certificates.\(^{116}\)

Whilst not included in the overview, there are several additional assurance initiatives in the marketplace. **MyOrigins** is one of these, a platform also aiming to deliver traceability for brands. MyOrigins aims to establish the digital credentials for RWS batches, by adopting digital data collection on the farm, and is backed by a Blockchain mobile app.\(^{117}\)

The development of such initiatives, and innovative use of technology is a positive sign of progress. **FOUR PAWS** strongly encourage brands choosing to continue selling wool, to consider the benefits and downsides of each scheme. In addition, we encourage brands to obtain the skills and support from supply chain and sourcing experts to ensure robust traceability.

**Facts:**
- Currently, there are no national or international standards specifically focused on non-mulesing and steining.
- Mulesing is a painful procedure involving the removal of the lambs from the ewes.
- Steining is a painful procedure involving the removal of the tails of live sheep.
- Both practices are prohibited in the mulesed-free wool assurance initiatives, ensuring animal welfare.

---

**Traceability and Audits**
- Farm audits are carried out by various certification bodies listed on the Textile Exchange website.
- Farm audits are mainly carried out by the certification body Control Union.
- Farm audits are carried out by the certification body Control Union.
- Farm audits are carried out by Global Compliance Asia.
- Farm audits are carried out by the standard setting body.

**Sustainability**
- SustainaWOOL Gold requirements include: 100% of farms are checked annually, and 100% of farms are inspected annually.
- SustainaWOOL Bronze requirements include: 100% of farms are checked annually, and 100% of farms are inspected annually.
- SustainaWOOL Silver requirements include: 100% of farms are checked annually, and 100% of farms are inspected annually.

**Authentication**
- Mulesing and steining are prohibited in the mulesed-free wool assurance initiatives.
- The mulesed-free wool assurance initiatives are designed to ensure the ethical treatment of animals and promote animal welfare.

**Conclusion**
- The mulesed-free wool assurance initiatives provide a clear framework for ensuring the ethical treatment of animals and promoting animal welfare.
- These initiatives are essential in promoting sustainable and responsible practices in the wool industry.

- SustainaWOOL (2021). 
**Additional considerations:**

- While FOUR PAWS encourages the use of effective certification schemes, it is acknowledged that they cannot always provide a 100% guarantee.

- The National Wool Declaration is neither a standard setting body nor a certification scheme as such, however it has been included due to its high-level of use within Australia to date.

- FOUR PAWS is against any form of breech mutilation/modification. This includes mulesing and a new form of breech modification called steining (the use of liquid nitrogen). Recent research confirms that both methods are significantly painful for lambs, with animals showing signs of distress and discomfort even when some level of pain relief is applied. FOUR PAWS has informed each of the initiatives above that steining should not be certified as non-mulesed, and for wool coming from steined sheep – that this should be clearly labelled as such.

- Parallel production refers to whether producers can sell both non-mulesed and mulesed wool.

- The aim of the Chain of Custody approach is to preserve the identity of the claimed material, and to track its movement through the supply chain. As shown below, this can be done through Scope Certificates (SC) and Transaction Certificates (TC), verifying that both the company is qualified to produce goods to a given standard, and the goods being shipped from one company to the next conform to the given standard.118

Dear Brands,

Thank you. You are an essential part of the solution for better sheep welfare.
Thank you for coming on the journey with us to transition towards mulesed-free wool supply chains. We hope this guidebook has been helpful to you and your team.

We know that brands are the link between animal fibre producers and garment makers, and the consumers who buy and wear the clothes. While change can start anywhere within the wool supply chain, brands are especially well-placed to lead the change away from mulesed wool.

By making a commitment and transitioning away from mulesed wool, it’s clear that brands will not only protect animals from an outdated and cruel practice, but will also safeguard their own business by mitigating significant risk and appealing to additional markets.

Now is the best time for brands to lead the way, and provide a strong demand signal by making a public commitment to phase out mulesed wool. Certified mulesed-free wool supply is slowly on the increase, non-mulesed wool sourcing specialists are opening shop, and wool accreditation initiatives and full supply chain traceability systems are becoming ever more robust and scalable.

FOUR PAWS invites brands along on a more ethical journey, starting with The Three Steps to Change (p 18). We are keen to collaborate with industry partners, and are open for further dialogue about flystrike, mulesing, and the solutions.

We welcome hearing from brand managers, sustainability and procurement managers and anyone who wants to improve animal welfare practices in their supply chain.

To contact us, please email textiles@four-paws.org. We look forward to working with you, and welcome any enquiries, updates or news regarding progress.

Only together can we end mulesing and improve the lives of millions of animals.

Nina Jamal
Head of Farm Animals Campaigns
FOUR PAWS International
FOUR PAWS has launched the Wool with a Butt campaign to raise awareness of mulesing and encourage brands to phase it out of their supply chains.
